

| Course Code | Course Title | L | T | P | C |
|-------------|----------------------|---|---|---|---|
| 17CE007 | MATHEMATICAL METHODS | 4 | 0 | 0 | 4 |

Course Objectives:

1. To impart knowledge about various methods of analysing linear equations numerically.
2. To familiarize students in the field of Interpolation
3. To expose the students to calculus of Numerical integration and differentiation techniques.
4. To familiarize the students in the field of partial differential equations to solve boundary value problems associated with engineering applications.
5. To expose students to the concept of linear programming optimization techniques.

Course Outcomes:

At the end of the course student will be able

1. To apply Eigen value problems in finding natural time period and mode shapes of structures.
2. To apply interpolation and differentiation formulas for calculating deflection of beams, analysis of columns and simply supported beams.
3. To apply numerical integration and differentiation techniques in calculation of slopes and deflections of beams.
4. To analyze one dimensional heat flow equations using partial differential equations.
5. To learn linear optimization techniques.

Activities:

1. Form Mass matrix and Stiffness matrix for any 3 story building and Find its Natural time period and Mode shapes using Eigen values and vectors.
2. Analyze any simply supported beam using numerical solutions of interpolation and differential techniques.
3. Calculate slope and deflection of any beam with different boundary conditions.
4. Apply partial differential technique for solving any 1-D heat problem
5. Optimize any quantity related to civil engineering problems using Linear Programming Techniques.

Skills:

1. Ability to develop Eigen values and vectors for finite element analysis
2. Develop the caliber to generate mathematical equations for elasticity problems
3. Optimization of structures by forming Linear Programming Techniques
4. Analysis of heat transformation using partial differential equations

UNIT-I: Solutions Of Linear Equations

Direct method – Cramer’s rule, Gauss – Elimination method - Gauss – Jordan elimination – Triangulation (LU Decomposition) method – Iterative methods Jacobi – Iteration method – Gauss – Siedel iteration, Eigen values and Eigen vectors: Jacobi method for symmetric matrices- Given’s method for symmetric matrices-Householder’s method for symmetric matrices-Power Method.

UNIT –II: Interpolation

Linear Interpolation - Higher order Interpolation - Lagrange Interpolation- Interpolating polynomials using finite differences, differentiation formulas by Interpolating parabolas – Backward, Forward and Central differences- Derivation of differentiation formulas using Taylor series, Boundary conditions- Beam deflection Numerical solution to spatial differential equations – Application to Simply Supported Beams, Columns.

UNIT-III: Numerical Integration And Differentiation

Numerical Differentiation: Difference methods based on undetermined coefficients- optimum choice of step length– Partial differentiation.

Numerical Integration: Method based on interpolation-method based on undetermined coefficient – Gauss – Lagrange interpolation method– Double integration using Trapezoidal and Simpson’s method New Marks Method and Application to Beams – Calculations of Slopes & Deflections.

UNIT-IV: Applied Partial Differential Equations

One-dimensional Heat equation Cartesian, cylindrical and spherical coordinates (problems having axi-symmetry). Two-dimensional Laplace Equation in Cartesian, cylindrical and spherical coordinates (problems having axi-symmetry) – Analytical solution by separation of variables technique.

UNIT-V: Linear And Nonlinear Programming Techniques

Linear Programming Problem Formation, Graphical Method, Simplex method, artificial variable method-Big-M method-Two Phase Method. Non Linear Programming Problem Gradient method, Steepest Ascent Descent Methods
